Predgovor

Savezna uprava hidrometeorološke službe FNRJ počinje objavljivanje svoje publikacije Meteorološki godišnjak I, u kojem su sadržani podaci osmatranja svih meteoroloških stanica višeg reda na teritoriji FNRJ, sa 1949 godinom.

Od prikupljenih i sredjenih podataka osmatranja za tri prve godine od osnivanja Hidrometeorološke službe FNRJ: 1947, 1948 i 1949 — Savezna uprava objavljuje prvo 1949 godinu, dok će prethodne dve objaviti docnije, da bi se što pre postiglo blagovremeno izlaženje ove publikacije.

U ovom Godišnjaku vrednosti meteoroloških elemenata na teritoriji FNRJ u toku 1949 godine prikazane su podacima meteoroloških stanica u tablicama:

- A) Dnevna osmatranja (za 7 stanica: Ljubljana, Zagreb, Split, Sarajevo, Beograd, Titograd i Skopje) i
- B) Mesečni i godišnji pregledi za 185 stanica višeg reda.

Beograd, 1954.

Avant-propos

La Direction fédérale du Service hydro-météorologique par l'année 1949 commence la publication de son Annuaire météorologique I contenant les données des observations de toutes les stations météorologiques, à l'exception des stations pluviométriques, sur le territoire de la Yougoslavie.

Les observations antérieures faites au cours des années 1947 et 1948, depuis la création du Service hydro-météorologique de la R.F.P. de Yougoslavie, seront publiées en même temps que celles des années suivantes et aussi rapidement que possible avant que le délai de la publication ne devienne normal.

La présentation de cet Annuaire est faite sous forme de tableaux dans lesquels on trouve:

- A) les observations quotidiennes pour les sept stations, à savoir: Ljubljana, Zagreb, Split, Sarajevo, Beograd, Titograd et Skopje;
- B) les résumés mensuels et annuels pour 185 stations.

Beograd, 1954.

Objašnjenja

Značenje upotrebljenih oznaka je sledeće:

φ = geografska širina, λ = geografska dužina od Griniča, ΔG = vremenska razlika u odnosu na Grinič, H_s = nadmorska visina podnožja kišomera, H_b = nadmorska visina rezervoara barometra, h_t = visina rezervoara termometra iznad tla, h_r = visina otvora kišomera iznad tla.

Oznake pojedinih elemenata su upotrebljene prema međunarodnim konvencijama, a vrednosti su date u ovim jedinicama:

P = vazdušni pritisak u mm visine živinog stuba, reducirane na 0°C ; T = temperatura u $^\circ\text{C}$; e = pritisak vodene pare u mm visine živinog stuba; U = relativna vlažnost u procentima; D = pravac vetra po ruži vetra od 16 ili 8 pravaca; F = jačina vetra po Boforovoj skali (0—12); v = brzina vetra u m/sek; V = vidljivost u km; N = oblačnost (0—10); insolacija = trajanje osunčavanja u satima; R = padavine u mm; h_s = snežni pokrivač u cm; W = razvoj vremena (vrsta pojave, intezitet i trajanje) opisan međunarodnim simbolima.

U rubrici „Razvoj vremena“ su upotrebljene ove skraćenice:

n = u toku noći; a = pre podne; p = posle podne; na = u toku noći, posle ponoći; np = u toku noći, pre ponoći; i = s prekidima.

Srednje dnevne i mesečne vrednosti temperature vazduha izmerene u 7, 14 21h po lokalnom vremenu računane su po formuli

$$\frac{t_7 + t_{14} + 2 \times t_{21}}{4},$$

a za ostale elemente (P , e , U , N) srednje dnevne i mesečne vrednosti dobijene su kao proste aritmetičke sredine terminskih vrednosti.

Ekstremni termometri su očitavani i uredjivani u 21h i vrednosti ubeležavane na dan merenja.

Dnevne vrednosti padavina se odnose na protekla 24 sata, od 7h prethodnog dana do 7h dana merenja u koji su zabeležene.

Visina snežnog pokrivača je merena u 7h.

U tablicama A masnim znacima su obeležene vrednosti maksimuma vazdušnog pritiska, temperature vazduha, pritiska vodene pare, jačine vetra kad ona iznosi najmanje 6 po Boforu, i padavina. Kurzivom su obeležene vrednosti minimuma vazdušnog pritiska, temperature vazduha, pritiska vodene pare i relativne vlažnosti.

U tablicama B za srednje mesečne ekstreme temperature vazduha upotrebljene su oznake $\overline{Max}$ i $\overline{Min}$; za rubrike broj dana sa $\bullet$ ili $\bullet$, $\ast$ ili Δ , i $\ast$ prebrojani su samo dani kad je visina naznačenih padavina iznosila najmanje 0.1 mm.

Notice explicative

Les notations employées sont les suivantes:

φ = latitude, λ = longitude E de Greenwich; ΔG = difference entre l'heure locale et l'heure de Greenwich; H_s = altitude du pied du pluviomètre, H_b = altitude de la cuvette du baromètre, h_t = hauteur, au dessus du sol de la base du thermomètre, h_r = hauteur, au dessus du sol, de l'entonnoir du pluviomètre.

La désignation des éléments météorologiques et les unités de mesure sont conformes aux conventions internationales.

P = pression atmosphérique en mm (hauteur de la colonne du mercure réduite à 0°C); T = température en $^\circ\text{C}$; e = tension (pression) de la vapeur d'eau en mm (hauteur de la colonne de mercure); U = état hygrométrique (humidité relative); D = direction du vent en rose de 8 ou de 16 directions; F = force du vent d'après l'échelle de Beaufort (0—12); v = vitesse du vent en m/s; V = visibilité en km; N = nébulosité (0—10); insolation = durée d'insolation en heures et dixièmes; R = précipitations en mm; h_s = épaisseur de la couche de neige en cm; W = description du temps (indication du phénomène, son intensité et sa durée) en utilisant les symboles internationaux.

Des précisions sont données par les abreviations suivantes:

n = pendant la nuit; a = avant midi; p = après midi; na = pendant la nuit, après minuit; np = pendant la nuit, avant minuit; i = en intervalle.

Les valeurs moyennes de la température quotidiennes et mensuelles — à 7 h, à 14 h et 21 h sont calculées d'après la formule:

$$\frac{t_7 + t_{14} + 2 \times t_{21}}{4},$$

et pour les autres éléments (P , e , U , N) on calcule les valeurs moyennes quotidiennes et mensuelles des observations faites à 7 h, 14 h et 21 h.

Les lectures des thermomètres à extrêmes suivies de l'amorçage de ces thermomètres ont été faites à 21 h et les valeurs enscrites à la journée correspondante.

Les valeurs quotidiennes des précipitations relevées à 7 h sont celles de 7 h la veille à 7 h le matin.

L'épaisseur de la couche de neige est mesurée à 7 h.

Dans les tableaux A sont marquées en caractères gras les valeurs maxima de la pression atmosphérique, de la température, de la tension (pression) de vapeur d'eau, de la force du vent ($F \geq 6$ de l'échelle Beaufort) et des précipitations.

Dans les tableaux de la partie B pour des extrêmes moyens mensuels de la température de l'air sont employés les indications $\overline{Max}$ et $\overline{Min}$; dans les rubriques de mêmes tableaux „Broj dana sa“ (Nombre de jours avec) $\bullet$ ou $\bullet$, $\ast$ ou Δ , et $\ast$ sont énumérés seulement les jours quand l'hauteur des précipitations était moins 0.1 mm.

AZBUČNI SPISAK STANICA
PO NARODNIM REPUBLIKAMA

Znak x pokazuje da stanica raspolaže odgovarajućim podacima meteoroloških elemenata navedenih u kolonama 7—14.
